	Paper Title	Automatic Filling System For Industry	
	<p>Abstract: - The project is aimed at automatic bottle filling and leakage sensing. This project will automatically detect the bottles using IR sensors. The overall system is liberated from human interventions. The efficiency of this system is high and it helps in automatic bottle filling and leakage sensing. Control system is the main part which includes AVR programming to control various components in this system. It is aimed to eliminate the various problems faced by small scale industries while filling the bottles. This system works automatically and reduces working and operation costs respectively.</p> <p>Keywords: - Bottle Filling, disk, Process Automation, leakage sensor, position sensor, bottle, stepper motor, pipe</p> <p>Reference</p> <ol style="list-style-type: none"> 1. 	Paper Title	Scrolling Led Board Using Bluetooth	
	<p>Abstract: - Display boards are primary thing in any institute, organization, public utility places like bus stops, railway stations, parks, shopping malls to display information regarding platforms, various advertisements about the products, or important notices. The design of “Smart Scrolling LED Display using Bluetooth” utilizes low cost and user can access multiple applications. People are now adapted to the idea of the world at its fingertips. Thus, If anyone wants to display the message they can send message through using android Bluetooth by using this project. This project deals with advanced wireless Android development board. The main objective of this project is to design a wireless board that displays messages sent from android phone user using Bluetooth. The main controlling device of the whole system is android Matrix LED Display module, Bluetooth module is interfaced to android and android development tool with APK application.</p>

	<p>Paper Title</p>	<p>Enhanced Cyclostationary Techniques for Cognitive Radio</p>	
	<p>Abstract: - Information communication has been reached its top level today. From grass root level to top level of society, all are connected with information communication. With increase in knowledge based data/ Entertainment Based data / Economical Based data / Social Based data, Information technology & Communication becomes integrated part of common man’s life. Not only commons life but we can say life of each and every individuals in society is reliable over Information communication & technology. Increase in Information data is proportional to Increased Users. Though Users are increased although the resources like Channel bandwidth required for communication has its limit. The proposed system is handling the same issue of Communication channel utilization against increasing number of users. To utilize and maximize number of users with same number of channels, the proposed system has introduced the Enhanced Cyclostationary technique for Cognitive Radio.</p> <p>Keywords: Cognitive Radio, Cyclostationary Technique, Matlab, Primary User, Secondary User</p> <p>Reference</p> <ol style="list-style-type: none"> 1.1. Paper Title	IOT Based Smart Poultry Farm Monitoring & Controlling using Embedded System					
CTEEE004	<p>Abstract: - IoT is a revolutionary technology that represents the future of communication & computing. Now days IoT is used in every field like smart homes, smart traffic control, smart cities etc. The area of implementation of IoT is vast and can be implemented in every field. This paper is about the implementation of IoT in Poultry Farming. IoT helps in better management, better resource management, cost efficient farming, improved quality and quantity, birds and animal monitoring and field monitoring etc. can be done. The sensors used in proposed model are air temperature sensor, air quality sensor, humidity sensor, etc. In this paper typical agriculture methods used by farmers these days and what are the problems they face are discusses, for more information about new technologies in farming. The proposed model is a simple architecture of IoT, in which sensors collect information and send it to arduino. Then this data values send to raspberry pi and compared this data values with threshold value to control the environmental condition inside poultry farm. A smart farm operates on both automatic and manual modes, for various operations. The controller keeps monitoring the temperature, humidity, air quality and brightness inside the field.</p> <p>Keywords: - DHT11; LDR;MQ 135;Arduino; Raspberry PI</p> <p>Reference</p> <ol style="list-style-type: none"> 1.
