ABSTRACT*:*

In the present work the problem of circular disc with a central hole and a symmetrical array of non-central holes subjected to rotation are analysed using Finite Element Method. The Stress Concentration Factors (SCF) is derived for various geometric parameters like, R2/R1, d/2R1, R_b/ (R2-R1) and number of holes (N). It is seen that, as the number of holes increases, the SCF decreases. The results are compared with the analytical solution given by H.E.Ang and C.L.Tan.

KEYWORDS: *Disc, Non central hole, Stress concentration, FEM*

NOTATION

A, B, C - positions at edges of holes shown in fig.1.
R_1 - Radius of central hole (bore) of disc
R_2 - Outer radius of disc
R_b - Pitch circle radius of holes
d - Hole diameter
N - Number of holes
E - Modulus of Elasticity
υ - Poisson's ratio
ρ - Density of material
ω - Angular velocity of disc
σ_θ - Hoop stress or tangential stress
σ_r - Radial stress
$(\sigma_\theta)_A$ - Hoop stress at point A
$(\sigma_\theta)_B$ - Hoop stress at point B

1. INTRODUCTION

There are machines elements which rotate while performing the required functions. These include flywheels, thin rings, circular discs, pulley rims, cylinders and spherical shells. Due to rotation, centrifugal stresses are developed in these elements. Rotating disc shown in fig.1 found in numerous industrial applications. High centrifugal stresses, radial and hoop stresses occur at the non- central holes needed to bolt discs together rotating at high speed, such as compressor and turbine rotors of aircraft engines, flywheel, gears, etc.

In the present work the problem of circular disc with a central hole and a symmetrical array of non-central holes subjected to rotation is analysed by using Finite Element Method (FEM).

The finite element approach is used to evaluate the stresses in the rotating disc with central hole by varying R_2/R_1, $d/2R_1$, $R_b/(R_2-R_1)$ and number of holes (N) and to study the effect of variation of these parameters in the stress concentration factor in the disc.

2. INTRODUCTION TO PROBLEM

In this project, effect of non-central holes in disc with central hole is investigated considering various geometrical parameters of the disc. The disc is shown in fig.1.

International Journal of Topical Areas in Mechanical Engineering (IJTAME)
Volume 1, Issue 1, September 2020, ISSN:

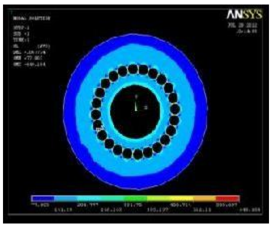
The various geometric parameter ratios & their variation are as follows,
R_2 / R_1 = 3, 4, 5, 6, 7, 8, 9, 10
$d / 2R_1$ = 0.025, 0.05, 0.075, 0.1, 0.125, 0.15, 0.175,0.2, 0.225, 0.25
$R_b/(R_2 – R_1)$ = 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9,1.0
N = 4, 6, 8, 10, 12,14,16,18, 20, 24, 28, 32, 36, 40
The disc is made up of steel and its mechanical properties are tabulated in Table.1.

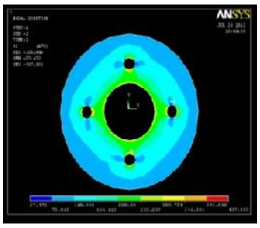
Modulus of elasticity (MPa)	E	200x103
Poisson's Ratio	ν	0.3
Density of material (Kg/mm^3)	ρ	7800

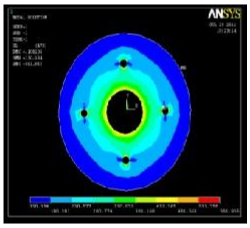
Table 1: Properties of Material

3. VARIATION OF SCF WITH RESPECT TO GEOMETRICAL PARAMETERS EVALUATED BY FE APPROACH

Principal stress contours for some ratios R_2/R_1, $R_b/ (R_2-R_1)$, $d/2R_1$, N are shown in fig.2 to fig.5 as an illustration.







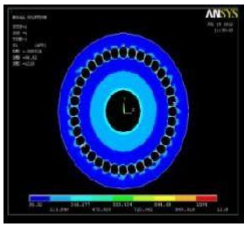


Fig.2: Principal Stress Contour (σ_θ) for R_2/R_1 =3, $R_b/(R_2-R_1)$=0.8, $d/2R_1$=0.2,N=24

Fig.3: Principal Stress Contour (σ_θ) for R_2/R_1=3, $R_b/(R_2-R_1)$=0.9, $d/2R_1$= 0.225 , N=4

Fig.4: Principal Stress Contour (σ_θ) for R_2/R_1= 4, $R_b/(R_2-R_1)$= 0.8, $d/2R_1$=0.2, N=4

Fig.5: Principal Stress Contour (σ_θ) for R_2/R_1=4, $R_b/(R_2-R_1)$=1,$d/2R_1$=0.25, N=36

An effort is made to show the variation of SCF with respect to geometrical parameter of disc i, e, $R_b/(R_2-R_1)$, R_2/R_1, $d/2R_1$ and number of holes (N). These variations are shown in Fig.6 to Fig. 13.

Table 3: Comparison of FE and Analytical Results for the $d/2R_1$=0.075 $ - Stress Concentration Factor reported by H.E. Ang and C.L. Tan.

It is seen from the Table 2 & 3 that the SCF determined by FE approach and with analytical approach differ by 62 to 84%.This confirms that the analytical solution represented C.L.Tan and H.E.Ang may need some correction factors depend upon geometry of perforated disc. Hence, it can be suggested that the analytical approach may needs some refinement to predict the actual SCF in perforated disc.

5. DISCUSSION AND CONCLUSION

1. It is observed that as the number of holes increases the SCF decreases for most cases. But for some cases it is observed that the SCF increases abruptly after certain number of holes. This may be due to very less pitch width between the two consecutive holes. Thus there is a limit for the maximum number of holes to

keep the working stresses within safe limits.
2. As it is also seen that as the pitch circle radius of non-central holes increases, the SCF decreases. Thus the non-central holes very close to the central hole should be avoided in practice.
3. As the diameter of non-central holes increases the SCF decreases. This may be due to the smoothening of stress lines over larger curvature of hole. Thus larger diameter of non-central hole is preferred in actual practice.
4. Stress Concentration Factors derived for various geometric parameters like, R_2/R_1, $d/2R_1$, $R_b/(R_2-R_1)$ and number of holes (N) can serve as a guideline for designing the perforated rotating disc.
